

## Dental Veneer Tips

What are dental veneers?

Dental veneers can be viewed as an actual shield to the external surface of the tooth and are specifically designed to improve its shape or colour. Basically, utilizing a dental veneer, the dental defects of the front teeth could be "masked" to perfection.

How many types of dental veneers are there?

Porcelain veneers are constructed with composite material, ceramic (porcelain) or zirconium. The composite ceramic veneers are inferior, but have the main advantage of low cost and quick installation time. Ceramic veneers are manufactured from highly durable porcelain and they manage to replace natural tooth translucency with high accuracy. They're smooth and impenetrable, meaning your teeth will be bright and white as the initial day.

How are dental veneers mounted?

You will find two kinds of procedures that can be used to mount veneers. The very first method is the "no prep / low prep" method which requires the usage of ceramic as thin as 0.3 mm, attached directly to the tooth surface, without the need for sanding prior to tooth enamel. This procedure takes about an hour or so to complete.

The 2nd method could be the "prep" method which involves minimally invasive dental enamel polishing before applying veneers. In cases like this, as much as 0.5 mm veneers work as half-crown that attached the tooth enamel replacement. Intervention on the tooth is minimal. The process requires two treatment sessions for optimal results. The task doesn't require anaesthesia; the patient does not feel any pain during dental veneers attachment.

In what cases are dental veneers recommended?

to cover broken or cracked tooth.

to cover slightly stained or discoloured teeth consequentially of treatment with tetracycline, fluorosis, or some other treatment;

to cover teeth with spots

to align abnormally shaped teeth; too big or too small teeth, crooked teeth

for improperly positioned teeth;

if teeth are crowded or there is space between them, then veneers close unsightly aspects of front teeth (called midline);

to cover unsightly fillings;

to cover gingival smile.

## About the Author

Porcelain veneers [root canal](#) are applied only on healthy teeth! If you will find serious dental problems or diseases such as for example gingivitis / periodontitis, then the disease must be treated first before veneers may be applied.
