You can use uv stick for restoring broken glass objects permanently. Furthermore, that cementing representative can also be widely employed for providing applications for bonding two or more glass materials together. The stick may heal easily in the event that you keep carefully the rejoined items of glass confronted with ultraviolet light for a few minutes. These pointers have explained the method in brief.

. You need to start the process by cleaning every glass shard using a lint-free, clear cloth drenched in a top quality glass cleaner. The glass solution you use for this specific purpose should be an ammonia-based product. If the parts are too little, ensure you perform the washing work carrying a couple of plastic gloves.

. Keep consistently the ultraviolet lamp prepared by messing it in to a light socket. Exactly how many bulbs or lamp sockets you will require depends on how big is the glass you're repairing.

. Today, apply a little decline of the UV adhesive onto a paintbrush; the brush you are applying should have manufactured bristles. Apply the stick on the damaged sides making even layers.

. Once the application procedure is over, press the stops of the damaged glass together to permit the surplus stick to squeeze out.

. Start all of the UV lamps and hold the repaired glass within 2 inches of the bulbs. You will have to keep carefully the glass in this position for five minutes. You need to use clamps for holding the glass in order to avoid opportunities of burns in the event the glass becomes also hot. [UV Adhesive for Glass to glass stick](#)

. Switch on the lamps and enable the fixed glass to cool. If expected, you can eliminate the surplus dried stuff as a result utilizing a razor. Keep on repeating the above measures and soon you are content with the results.
