

WHY YOU SHOULDN'T JUST "WAIT AND SEE" FOR YOUR CHILD'S SCOLIOSIS

It affects 3-5 % of the population. Usually it's evident between the ages of 9 -14 years old. We address early diagnosis in an early on blog ([Click Here](#)).

There are a few different types of scoliosis. The most commonly found form of scoliosis is called .adolescent idiopathic scoliosis&rdquo ;.Idiopathic means .of unknown origin&rdquo ;.But recent research into the reason for scoliosis seems to suggest that there is often a genetic factor which affects the control of the growth of the spine.

A different type of scoliosis that may develop is a degenerative scoliosis. This really is where in actuality the spine degenerates causing the spine to slowly develop curves.

Scoliosis can affect children and adults. In children it can be a more severe condition because it can rapidly progress as the child grows.

Most patients with scoliosis arrive at see us haven recently been diagnosed by their orthopaedic doctor. The prior advice most commonly fond of patients and their family unit members is to accomplish one of two things:

Surgery

Wait and see

.If curves are caught early enough (5-20 degrees), bracing or maybe more aggressive and, potentially, more costly treatment is usually not necessary..

Sometimes you will see physio or exercises given but these are not meant to fix the problem, and then stabilise the area and/or make the patient more comfortable.

Studies show that there's an electronic 100% possibility of progression in many cases of adolescent idiopathic scoliosis. This makes an early on diagnosis vital but additionally, if curves are present, early intervention. If curves are caught early enough (5-20 degrees), bracing or maybe more aggressive and, potentially, more costly treatment is normally not necessary.
