

## Disease Diagnosis

It is a fact that the association between the diagnosis and the diagnosis of the disease is possible. However, it is possible to determine its own importance in other systems. The mode of treatment may be holistic treatment, specific treatment, symptomatic treatment and general life support to the patient. Modern medicine gives more importance to the treatment, like Ayurveda, Homoeopathy, Siddha, Unani, Chinese medicine, Naturopathy etc. to give more importance to the holistic notion of treatment, ie, remedy section by considering the physical, mental and emotional characters and life situation of the sick individual.

However, in these systems, the condition is important, because, under certain circumstances, the functioning of the affected organism or the organism of your body has to be backed up. The in-patient may require some specific type of support, for that your organ should be used. Prognosis, prognosis, special precaution, prevention of spreading of disease. Diagnosis is extremely essential for statistics, research and also fulfills the academic interests. Above all, due to some medico-legal reasons, the doctor should to know the detailed health status of his patient. Due to all these reasons, the diagnosis is vital, regardless of the device of treatment given to the patient.

Both sides of the same coin, hence, both are experiencing equal importance. Disease diagnosis is performed by correlating the signs and symptoms of patients (clinical features) with the data written by the bystanders and the lab investigation reports. There are certain situations, which could be caused by a diagnosis, because of many diseases. Moreover, it is possible to find easily existing diseases, especially by a general practitioner. Under such circumstances, a specialist's opinion might be needed. Very rarely, a team of doctors are involved along the way of diagnosis.

It is difficult to call each and every one of us. Depending on the International Classification of Diseases (ICD-10), a distinctive percentage of diseases can not be named. Such cases, a diagnosis is achievable regardless of the patient's health. Since the patient is suffering, he needs to be treated symptomatically. Some symptoms or conditions are wrongly understood as diseases by the laymen. For example, clinical manifestations like jaundice, fever, vomiting, headache, malaise etc. are not diseases; but clinical manifestations of some diseases. The naming of the diseases is completed on several basis. Buerger's disease, Alzheimer's disease, Weil's disease,

If it is a small group of specific symptoms and symptoms, it is named syndrome (Edward syndrome, Down syndrome, Laurence-moon syndrome). Nowadays, we have a great deal of experience in the development of cardiovascular disease, diabetes, idiopathic hypertension, acid peptic disease, senile dementia, degenerative joint disease, and so on. Many diseases are classified under certain band of disorders. Like: Degenerative Joint Disorders, Inflammatory Bowel Disorders, Psychosomatic Diseases, Life Style Disorders etc. Here, each group includes several diseases, but are grouped together for certain common features such as for instance pathological or etiological features.

Whenever can not be possible because of various reasons. However, the physician can come to a provisional disease diagnosis. After doing the laboratory investigations, the ultimate diagnosis is performed by the clinical findings. However, the procedure is not kept in check until the final diagnosis, especially in the event of life threatening diseases such as diphtheria, the therapy must be started immediately when the disease is suspected, because, when we watch for the lab reports to come, the individual may be critical. Some recent laboratory tests

The development of science and technology has a revolution in medical science. Now, the concept of disease diagnosis is only on the basis of clinical examination is outdated. It's now beneath the custody of some sophisticated machines and laboratory techniques, a few of them pose more risk to the health. But, the noteworthy point is, under all the reports, a disclaimer is written as "correlate with clinical findings", which emphasizes the importance of case taking and clinical examination by the doctor. In this era, the doctor-patient relationship is disrupted, we come across many patients saying that the physician has abruptly prescribed the medicine or referred for testing.

The recent studies conducted at the University of New York. They unearthed that the name of the condition is more panic among the patients. For instance, a person having a hearing may be uncomfortable when he or she has been diagnosed with the disease, he or she may be embarrassed if the patient has Gastro-esophageal reflux disease, that will be the medical terminology for recurrent burning eructations. The same happens in all cancer patients; The condition is diagnosed as cancer, the mental and emotional status starts deteriorating. But, the doctor cant hide the illness from the in-patient due to many medical and legal issues. The ultimate alternative is always to tell the diagnosis to the bystanders of the patient.

For an accurate disease diagnosis, the cooperation of the patient and its members of the family is extremely essential. Each and every one must be told to the doctor. Some silly matter for the patient may be vital for diagnosis and treatment. Similarly, outward indications of long duration may be ignored by some patients. Purposeful hiding symptoms may be dangerous. Some patients did not tell the doctor about the procedure he had taken previously. Frequent change of doctor can also cause difficulties. During consultation, patients clothes, life situations, characters, food and bowel clothes, relationship with others etc must be told. The reports of previous treatment and investigations must be made, which can save a sufficient time for a diagnosis. Always ask for a discharge while getting discharged from any hospitals. While consulting a doctor, always take a look at the patient.

The in-patient may also be referred to as having a prior complaint. In this busy life, there is a development that is opposed to a patient going to the physician, he sends somebody to the doctor for a "consultation" .Also there is a growth of men and women preferring over-the-counter purchase of drugs without a prescription. Do not forget to share with him completely. ## About the Author

Whenever is a patient who becomes serious through the course of treatment, the next phase would be a follow-up to the doctor's case or by attacking the doctors and hospitals, a consequence of a medical crisis and a preconceived regarding [polissonografia brasilia](#) . Nowadays this is a common story in most of the news papers. By promoting the doctor-patient relation ship (which is deteriorating nowadays), and also by going back to the "outdated" family doctor concept, we are able to solve all of the health related issues.
