HTML Editors Download

NotePad ++

Notepad++ is a favorite free note taking app and code editor. It is a more robust version of the Notepad software that you would find available in Windows by default. That being the case, this is a Windows-only option. It includes things like line number, color coding, hints, and other helpful tools that the standard Notepad application does not have. These additions make Notepad++ an ideal choice for web designers and front end developers.

Aptana Studio

Back when I was learning HTML and CSS, Aptana Studio is one of my favorites due to it being free, open source and filled to the brim with useful features. In case you are wondering, Aptana Studio is not your run-of-the-mill code editor. It is a full-blown IDE (Integrated Development Environment) that lets you play with web standards like HTML, CSS, and Javascript. Additionally, you can also deal with PHP, Python, and Ruby. Moreover, Aptana Studio has one of the best-integrated debugger using which you can inspect variables, set breakpoints, control execution, etc., to deal with bugs.

Apart from the usual features, Aptana Studio has built-in Git integration. If you already have a website, you can use the included Deployment Wizard to sync setups, upload and download files using FTP, SFTP, and FTPS protocols. When dealing with Ruby, you can use the same deployment wizard to automatically publish your applications.

Arachnophilia

Developed by Paul Lutus, and written in Java, Arachnophilia is a trusted source code editor. It is also regarded as a successor to another HTML editor . WebThing. It is a free and open source HTML editor that works under GNU Lesser General Public License (LGPL) and its stable version 5.5.2922 release date is November 18, 2016. It works on the Java SE platform.
